

# HELCATS WP7 Overview/Type II

Bob Forsyth on behalf of Jonathan Eastwood

HELCATS kick-off meeting 14 May 2014, RAL

## Work Package 7

### Assessing the complementary nature of radio measurements of solar wind transients

- *Duration:* Months 10 – 36
- *Participants:* Imperial, ROB, STFC
- *Work package leader:* Jonathan Eastwood (Imperial)
- *Objectives:*
  - To identify and analyse potentially-geoeffective solar wind events that are observed by both HI and IPS, and use IPS to augment the HI observations.
  - To identify and analyse solar wind transients that are observed by both HI and in radio, and add value to the HI data by establishing/cataloguing the relationships between them.

## Motivation

- Recognising that radio observations are associated with heliospheric transients, this work package links **Inter-Planetary Scintillation** and **Type II radio emission** to the established Heliospheric Imager observed events.
- **IPS**: Solar wind density; solar wind speed can be retrieved if signals from the same radio source are received at spatially-separated receiver sites (*see next talk by Mario Bisi*)
- **Type II radio emission**: generated at shocks driven by coronal mass ejections, frequency corresponds to (harmonics) of the local plasma frequency, which is a function of density. Coordinated analysis of HI data and radio burst observations has been performed only on a case-by-case basis (e.g. Harrison et al., 2012)

## Tasks and deliverables

- **T7.1** - Identifying and analysing potentially-geoeffective solar wind events that are observed by both HI and IPS [Months: 10-36] STFC
- **T7.2** - Identifying and analysing solar wind transients that are observed by both HI and in Type II radio burst emission [Months: 10-36] IMPERIAL, ROB
- **D7.1** : Catalogues of EISCAT and LOFAR IPS data events and of S/WAVES events, both extending throughout the STEREO HI Mission timeline [month 27]
- **D7.2** : Report of initial comparison between IPS events and HI events. [month 30]
- **D7.3** : Report of initial comparison between solar radio-burst events and HI events. [month 30]

## Task 7.2

### Identifying and analysing solar wind transients that are observed by both HI and in Type II radio burst emission

- Combining STEREO solar radio-burst, coronagraph and HI observations enables unique study of the propagation of shock waves and their drivers (CMEs), as well as interaction of fast CMEs, all the way from the low corona to 1 AU.
- Solar radio-burst observations cover a broad frequency domain corresponding to different distances from the Sun.
- Key advantages of space-based radio measurements
  - effectiveness in tracking CMEs between coronagraph and HI FOV
  - analysis of events where fast CMEs interact.
- Will also leverage team participation in ground-based radio observations, (e.g. CALLISTO) that extend the data down to the low corona,

## S/WAVES (Bougeret et al., 2008, SSR)

- 3 orthogonal monopole electric antennas
- High frequency receiver 125 kHz – 16.025 MHz
- Low frequency receiver 2.5 kHz – 125 kHz
- Type II emission at fundamental and harmonics of plasma frequency
- $f = 8.98 \times 10^3 (n_e)^{1/2}$
- Use model to convert density to radial distance
- HFR frequency range – height of 10 Rs – lower boundary condition for the J-map analysis

## Example of Type II emission

## Activities in Task 7.2

- Developing a joint catalogue of CMEs observed in HI, and S/WAVES and Wind/WAVES data.
- Extending the catalogue with ground-based radio observations to examine more closely the source region of each CME.
- Constructing height-time statistics, and systematically examining usefulness of radio data in constraining modelling of CME lift-off and its impact on CME forecasting.
- Determining the number of interacting CME events and exploring how radio data can be used to decipher event kinematics and improve forecasting.

*Instruments used:* STEREO/SECCHI and SWAVES; WIND/WAVES

    - Login

You are here : [Start page](#)

→ **To consult the catalog:** no authentication is needed, just use the left menu.  
→ **To order products:** authentication is needed (see the 2 ways of connection hereafter).

### PUBLIC DATA

- STEREO / SWAVES (Quicklooks),
- DEMETER (Quicklooks),
- CLUSTER,
- DOUBLE-STAR,
- WIND,
- ULYSSES,
- INTERBALL,
- Swedish VIKING Mission,
- ARCAD-3,
- ISEE3/ICE,
- GEOS,
- EISCAT,
- Geomagnetic indices

### TO ORDER PUBLIC DATA You just need an e-mail @

1. - Click on the **Authenticate** link in the left menu,
  - Enter a **valid** e-mail address twice in the **Access to public data** panel.
2. An activation code is **immediately** sent at **this** e-mail address.
3. Enter the activation code (needed just once).
4. 😊 **You are now connected** 😊
5. **From now on**, simply log in by giving the same e-mail address as login and password in the left menu.

**Please note that your e-mail will NOT be used for commercial purposes. It is ONLY used to authenticate and to get back your ordered data files.**

### PRIVATE DATA

### TO ORDER PRIVATE DATA You need to be fully registered

### Quicklooks

Select quicklooks by ticking the 'Select' checkbox at the bottom of each image. When finished, click on the 'Create order' button to order the corresponding data objects. The ⓘ link displays the related information about a particular quicklook. The ↗ symbol allows direct order of the corresponding data object in your workspace (when direct order is available).

## Work plan for Task 7.2

---

- Start month 10
- Initial construction of S/WAVES catalogue, in the context of initial work on the HI catalogue
- Initial construction of CALLISTO catalogue, in context of initial work on the HI catalogue
- Identification of events for case study and detailed analysis
- Analysis of case studies
- Timing analysis of all events?
