

# HELCATS

## UGOE contribution to WP 2

Volker Bothmer & UGOE Team

HELCATS AM, 18-19 May 2015, Göttingen, Germany

# Objectives - WP 2, Task 2.3

---

- To update the STEREO/SECCHI/COR2 CME catalogue, initiated under the SOTERIA FP7 project (& DLR Stereo/Corona, AFFECTS), until the end of 2011 (including the application of forward modelling to the appropriate CMEs)
- Comparison of HI – COR2 catalogues

→ WP3

To compare the results from the geometrical and forward modelling of HI CMEs with the modelling results for COR2

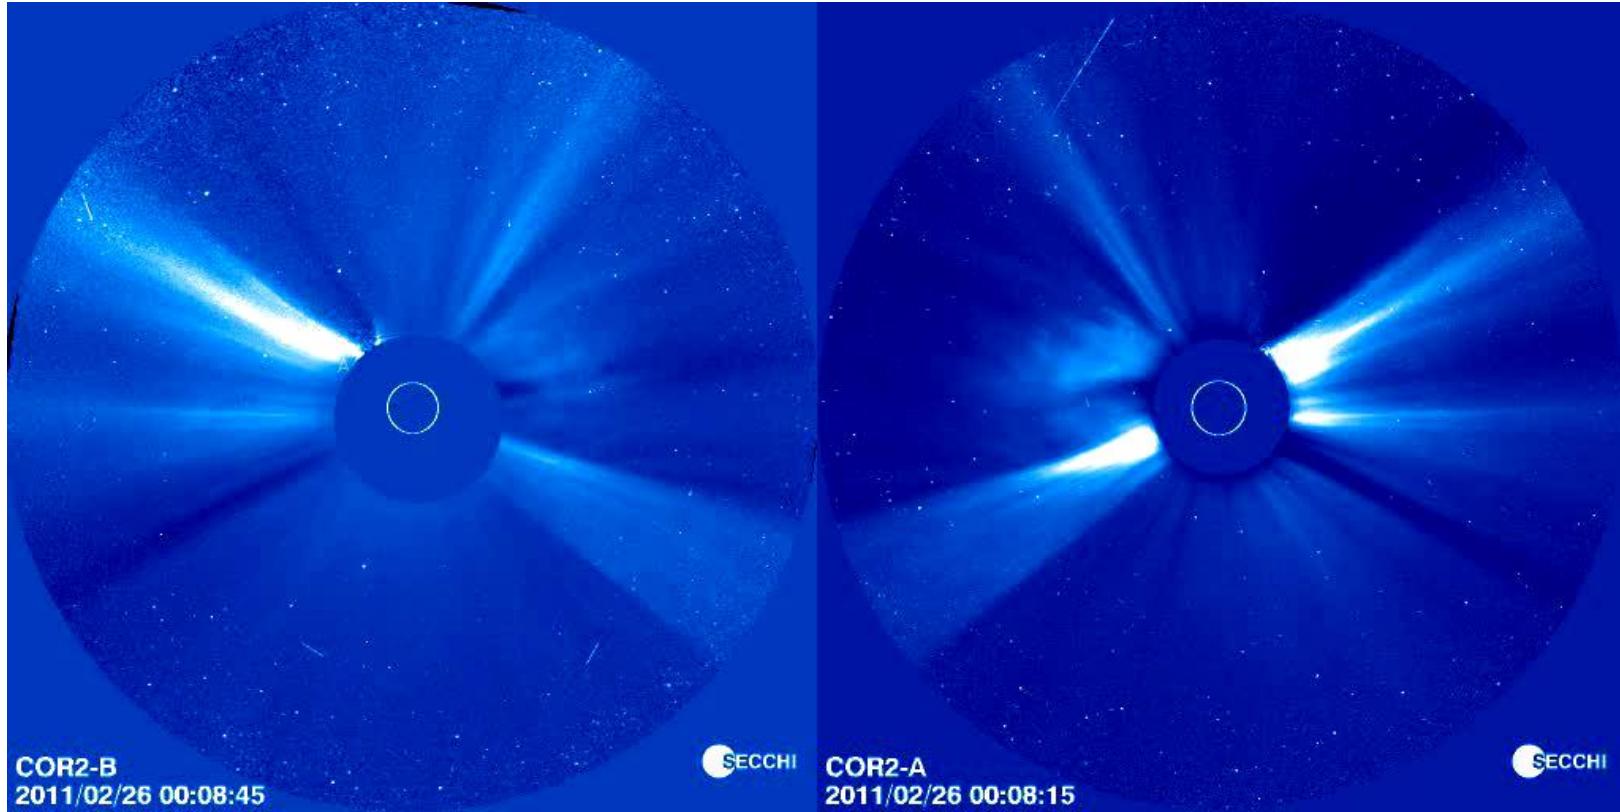

To prototype the use of inverse modelling to derive typical HI CME parameters (speed, size, mass), for photospheric and low coronal source regions typically associated with CMEs

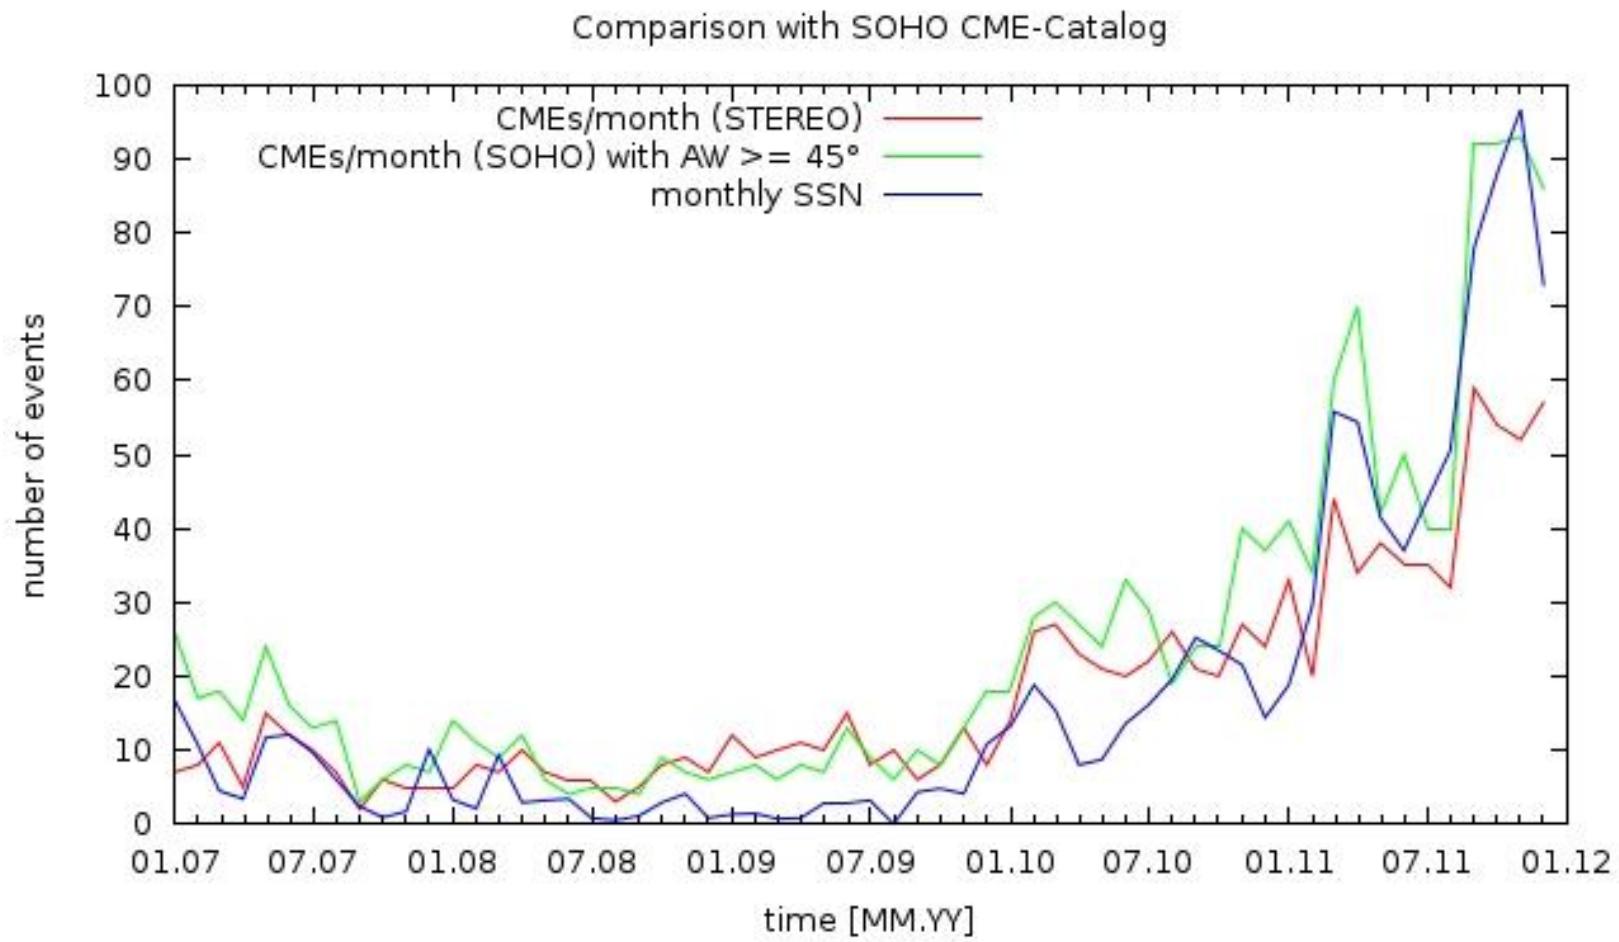

# Examples of STEREO/SECCHI/COR2 CME Observations

---

# CME-Häufigkeiten und Sonnenfleckencyklus

# Development of COR2 CME list

Selection  
Criteria

- Based on clarity of CME appearance in STEREO/SECCHI/COR2 FOV (2.5 – 15 R<sub>s</sub>)

Best-Of  
CMEs

- List with 1071 events until end of 2011 established

CME-  
Modeling

- 241 “best-of CMEs” studied by GCS modelling (Thernisien, Howard, Vourlidas, 2006) based on 3-D concept for CMEs (derived by Cremades & Bothmer , 2004)

All results are available online @ [www.affects-fp7.eu/cme-database/](http://www.affects-fp7.eu/cme-database/)

## Coronal Mass Ejection Database

Welcome to the STEREO/SECCHI/COR2 CME-Database of the Institute for Astrophysics, University of Goettingen, Germany. This site provides currently information on identified CMEs in the SECCHI/COR2 synoptic movies available at the [NRL SECCHI website](#) in the SECCHI/COR2 field of view at distances between 2 - 15 solar radii. Since launch of the STEREO mission in October 2006, 1071 bright above the coronal background appearing CMEs were identified from January 2007 until end of December 2011. For these events the database contains information about basic CME properties comparable to the [SOHO/LASCO CME catalog](#) and spacecraft positions. Out of a selected set of 264 CMEs, which appeared very clear in brightness and structure, 241 of them were analyzed with the Graduated Cylindrical Shell (GCS) modeling technique developed by [Thernisien, Vourlidas and Howard in 2006](#) based on the 3D CME scheme introduced by [Cremades and Bothmer in 2004](#).

# Sample STEREO/SECCHI/COR2 CME GCS Forward Modelling – December 12, 2008, 14:22 UT

The Fitting with the GCS Forward Modeling Code yields the following results.

GCS Fit-Parameter from Modeling:  
Carrington Longitude: **70.434**  
Carrington Latitude: **5.031**  
Tilt Angle: **50.870**  
Height: **16.071**  
Ratio: **0.268**  
Half Angle: **10.061**

Timestamp of used COR2-Images for Modeling: **20081212 14:22:00**  
#formatting: yyyyymmdd hhmmss

STEREO/SECCHI/HI-1A

2007-2013: 821 events

2007-2011: 496 events, 197 definite ones

STEREO/SECCHI/HI-1B

2007-Jun 2013: 698 events, 226 def. ones

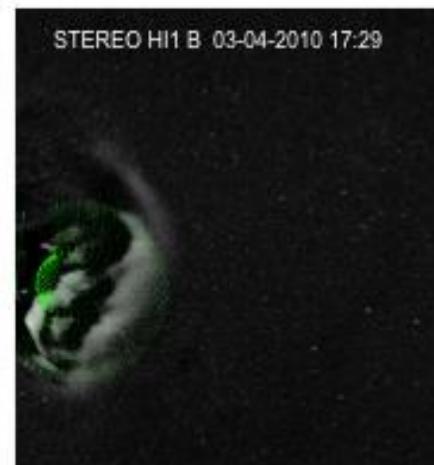

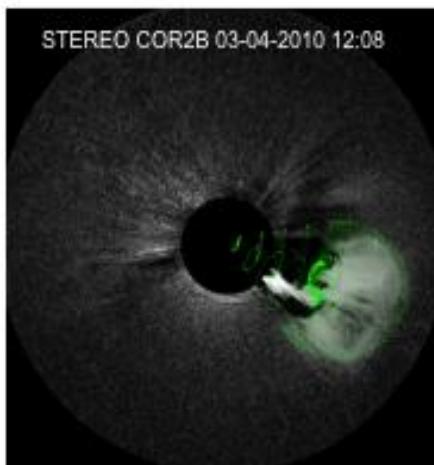

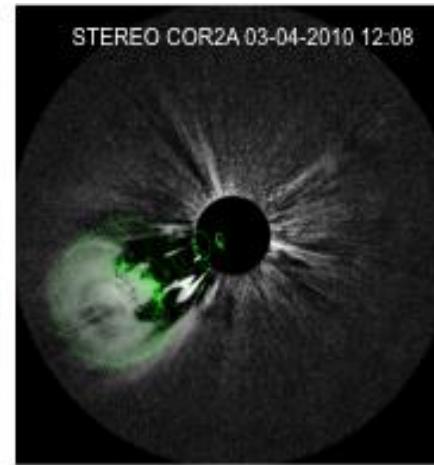

2007-2011: 399 events, 136 definite ones

Sample CME observed in the STEREO/SECCHI/COR2 and HI1 A and B fields of view on April 03, 2010 - The green grids are the CME GCS-fits.
