How the calculation of the CME mass might improve arrival time predictions

$$\frac{d^2r}{dt^2} = -\gamma(r) \left(\frac{dr}{dt} - w(r) \right) \left| \frac{dr}{dt} - w(r) \right|$$

DBM developed by Vršnak (2001)

Demo result: Mass and velocity fitting

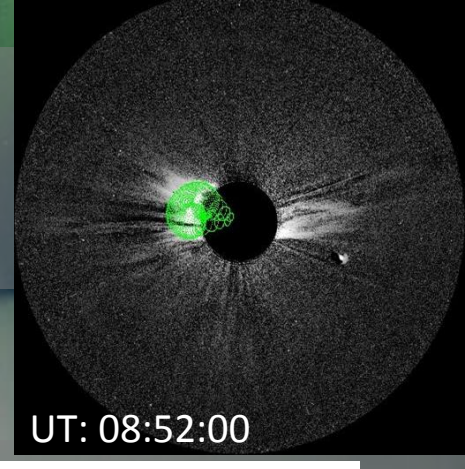

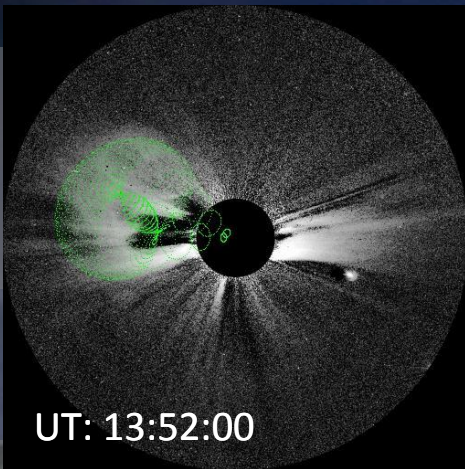

Used modified mass fitting function:

$$M_{CME}(h) = M_a \left(1 - e^{-(h-b)/H_a} \right)$$

The data analysis methods were developed in collaboration with the STEREO/SECCHI PI institution at the Naval Research Laboratory, Washington, DC, USA (A. Vourlidas, R. Howard, A Thernisien, N. Savani). The results will be made available through an online database catalogue under development.
